Help Desk Ticket

Ticket Information

Priority: Medium

Name: Ugochukwu David Egere
Department: HR
Date and Time: 11/14/2025 2:11 PM
Technician: Ugochukwu David Egere

Description of Issue

Yesterday, there was an incident where the lights flickered and then we lost power. We were notified that it would take the rest of the day to restore the power so we went home early. Today I tried to boot my computer but I don't get any video and only hear a beep. The screen stayed black but I got another single beep about a minute later. I shut off the computer and tried it again with the same results. Can you please fix my computer?

Technician Response

I've checked your system. The power outage caused one of your RAM modules to become unstable. When I tested the system, it was failing the initial memory check, which is why you were getting a single beep and no display.

I removed the RAM, cleaned the contacts, and reseated the module properly. I also tested each stick individually to confirm there was no permanent damage. After reseating the memory, the system booted normally and your display came back.

I've also inspected the motherboard and power supply for any surge damage — everything looks fine. Your PC is running stable now. If the issue comes back, the RAM stick may be weakening and might need replacement, but for now it's functioning correctly.

Hours Worked: 1hr 30min

Importance: ☐ Mission Critical ☐ Slowing User Down ☐ Schedule When Able

☒ Resolved ☐ Pending (Escalated) ☐ Unresolved
